

ABSTRACT

A communication system alerts wireless communication interfaces of incoming calls. The communication system includes a service control point. The service control point receives a call set-up message for an incoming call. The service control point processes the call set-up message to identify a wireless communication interface. The service control point then generates an alert message indicating the incoming call and caller information from the call set-up message. The service control point transmits the alert message to the wireless communication interface. The service control point receives a response message wherein the response message indicates a destination communication device to receive the incoming call. The service control point processes the response message to generate and transmit a routing instruction that connects the incoming call to the destination communication device.
